ST- Module-4

Assignment

Question: Mention what are the categories of defects?

Answer: Data Quality/Database Defects: Deals with improper handling of data in the database.

Critical Functionality Defects: The occurrence of these bugs hampers the crucial functionality of the application.

Functionality Defects: These defects affect the functionality of the application.

Security Defects: Application security defects generally involve improper handling of data sent from the user to the application. These defects are the most severe and given highest priority for a fix.

User Interface Defects: As the name suggests, the bugs deal with problems related to UI are usually considered less severe.

Question: Difference between Priority and Severity

Answer: Severity is a term that denotes how severely a defect can affect the functionality of the software and priority is a term that defines how fast we need to fix a defect.

Question: What is Bug Life Cycle?

Answer: The duration or time span between the first time defects is found and the time that it is closed successfully, rejected, postponed or deferred is called as 'Defect Life Cycle'.

Question: What is priority?

Answer: Priority is defined as a parameter that decides the order in which a defect should be fixed. Defects having a higher priority should be fixed first.

Question: What is severity?

Answer: Severity is defined as the extent to which a particular defect can create an impact on the software. Severity is a parameter to denote the implication and the impact of the defect on the functionality of the software.

Question: Bug categories are…

Answer: Software bugs can be classified into multiple categories based on their nature and impact. Broadly speaking, these categories include Functional Bugs, Logical Bugs, Workflow Bugs, Unit Level Bugs, System-Level Integration Bugs, Out of Bound Bugs, and Security Bugs.
